

Hive

Your AI team, living in Slack

Hive puts a team of AI assistants in your Slack workspace. Each one has a name, a role, and real tools — they handle email, manage tasks, answer questions, send texts, and work together. You talk to them like you'd talk to any coworker.

What Your Team Can Do

Just Message Them

Talk to your agents in Slack — in channels, DMs, or @mentions. They respond in seconds, in a thread, like a real teammate.

Handle Your Inbox

Agents read, search, and draft emails across your Google accounts. They check your calendar too. You approve, they send.

Answer Customer Texts

When a customer texts your business number, your agent reads it, drafts a response, and logs the conversation to Slack.

Track Projects

Create issues, update statuses, and query your project board — all through conversation. Integrates with Linear.

Research Anything

Ask your agent to look something up — competitors, documentation, market data. They search the web and summarize it.

Remember Everything

Agents keep notes and build knowledge over time. They remember context from past conversations and share knowledge across the team.

Pick Your Team

Start with just a Chief of Staff, or build out a full team. You name each agent and choose their personality during setup.

ROLE	WHAT THEY HANDLE
Chief of Staff	Your main agent. Coordinates everything, delegates to specialists, handles general requests. Always included.
VP of Engineering	Writes and reviews code, manages sprints and deployments, handles technical decisions.
Executive Assistant	Email, calendar, contacts, scheduling, travel research — your inbox and admin handler.
Product Manager	Features, bugs, roadmap, user research. Bridges the gap between business goals and technical work.

Marketing Manager	Content, campaigns, competitive analysis, social media strategy, market research.
DevOps Engineer	Server monitoring, deployments, infrastructure health, incident response.

What You Need

- **A Mac Mini** — this is where Hive runs, 24/7. An M-series Mac Mini is ideal. One machine handles everything.
- **A Slack workspace** — you probably already have one. Your agents show up there as bot users.
- **An Anthropic API key** — this powers the AI brain (Claude). Pay-as-you-go, typically \$30–100/month depending on usage.

That's it. The setup wizard installs everything else automatically and walks you through each step.

Cost breakdown: Mac Mini (~\$600 one-time) + Anthropic API (~\$30–100/mo) + Slack (free tier works). No subscriptions, no per-seat pricing, no cloud hosting fees. You own the hardware and all your data stays on it.

How Setup Works

Getting Hive running takes about 20 minutes. No technical expertise required — the setup wizard asks you questions and handles the rest.

1. **Create a Slack app** — the wizard gives you a pre-built config to paste into Slack's app builder. Two clicks.
2. **Enter your API keys** — Slack tokens and Anthropic key. Optional: SMS, email, project management integrations.
3. **Choose your agents** — pick which roles you want and give each one a name.
4. **Start Hive** — it runs as a background service that starts automatically when your Mac boots up.

After setup, talk to your agents in Slack. That's the whole interface — no dashboards, no portals, no new tools to learn.

What You Own

- **All your data stays local** — conversations, memory, contacts, and files live on your Mac Mini. Nothing is stored in the cloud.
- **Customize anything** — change an agent's personality, rename them, adjust what tools they can use. Changes take effect instantly.
- **No lock-in** — Hive is open source. You can modify the code, swap AI providers, or extend it however you want.
- **Agents learn over time** — they build up knowledge about your business, your preferences, and your workflows. All of it is versioned and searchable.

Ready to try it?

Get the repo, run the setup wizard, and your AI team is live in 20 minutes.
